

How to Deploy in Hostinger

- Before you start, make sure your project structure looks like this:

- Your github repository should look like this:

- I recommend you paste this in your .gitignore file

```
#-----  
# Operating Specific Junk Files  
#-----  
  
# OS X  
.DS_Store  
.AppleDouble
```

```
.LSOoverride

# OS X Thumbnails
.*_*

# Windows image file caches
Thumbs.db
ehthumbs.db
Desktop.ini

# Recycle Bin used on file shares
$RECYCLE.BIN/

# Windows Installer files
*.cab
*.msi
*.msm
*.msp

# Windows shortcuts
*.lnk

# Linux
*~

# KDE directory preferences
.directory

# Linux trash folder which might appear on any partition or disk
.Trash-*

#-----
# Environment Files
#-----
# These should never be under version control,
# as it poses a security risk.
.env
.vagrant
Vagrantfile

#-----
# Temporary Files
#-----
writable/cache/*
!writable/cache/index.html

writable/logs/*
!writable/logs/index.html

writable/session/*
```

```
!writable/session/index.html

writable/uploads/*
!writable/uploads/index.html

writable/debugbar/*
!writable/debugbar/.gitkeep

php_errors.log

- Go to the Hostinger and Login

Mag log in

Email

Password 

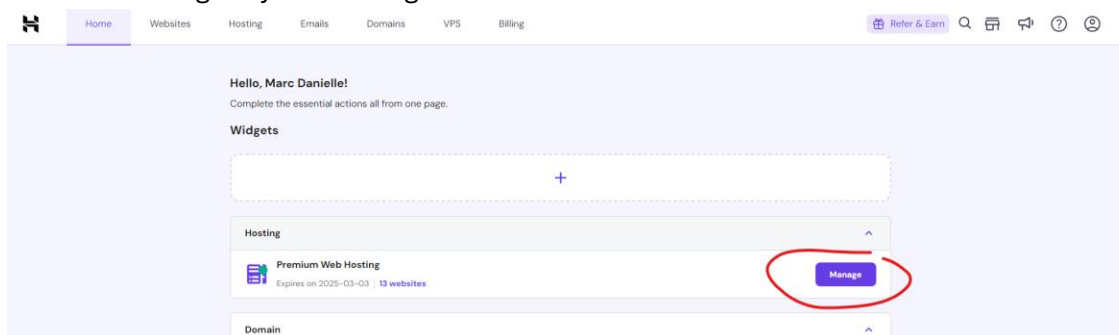

☐ Remember me

Mag log in

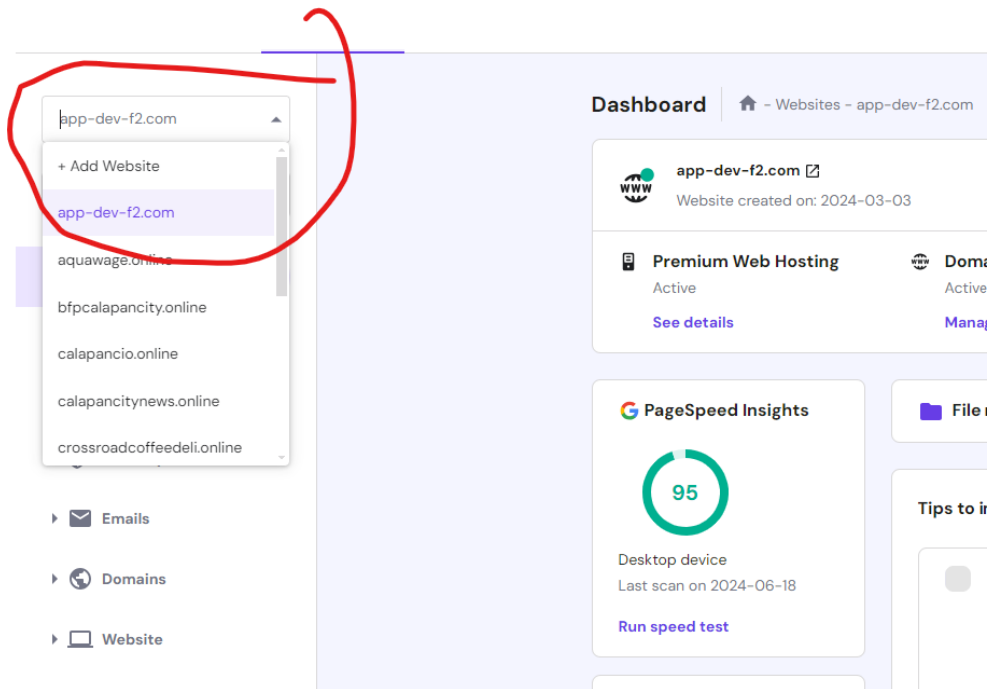

Nakalimutan ang password?

hindi pa miyembro? Pumili ng plano sa [pagho-host](#) at magsimula ngayon!

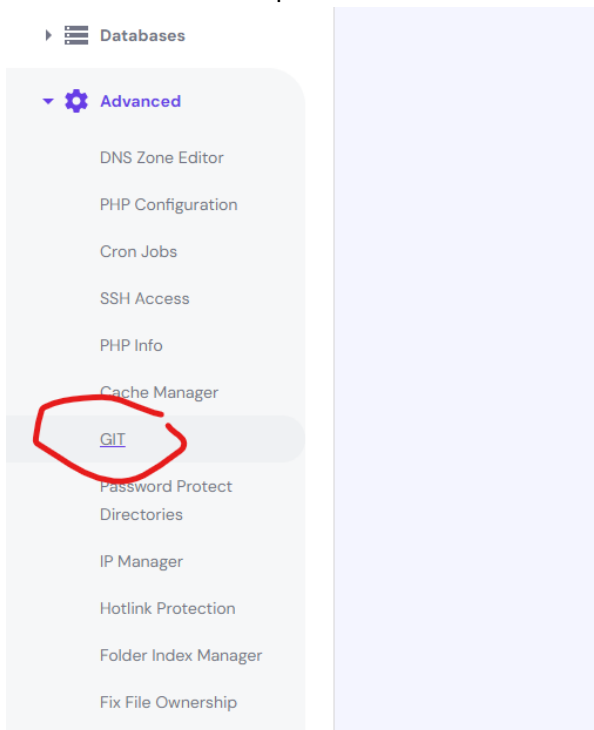

- Click the Manage in your Hosting Plan

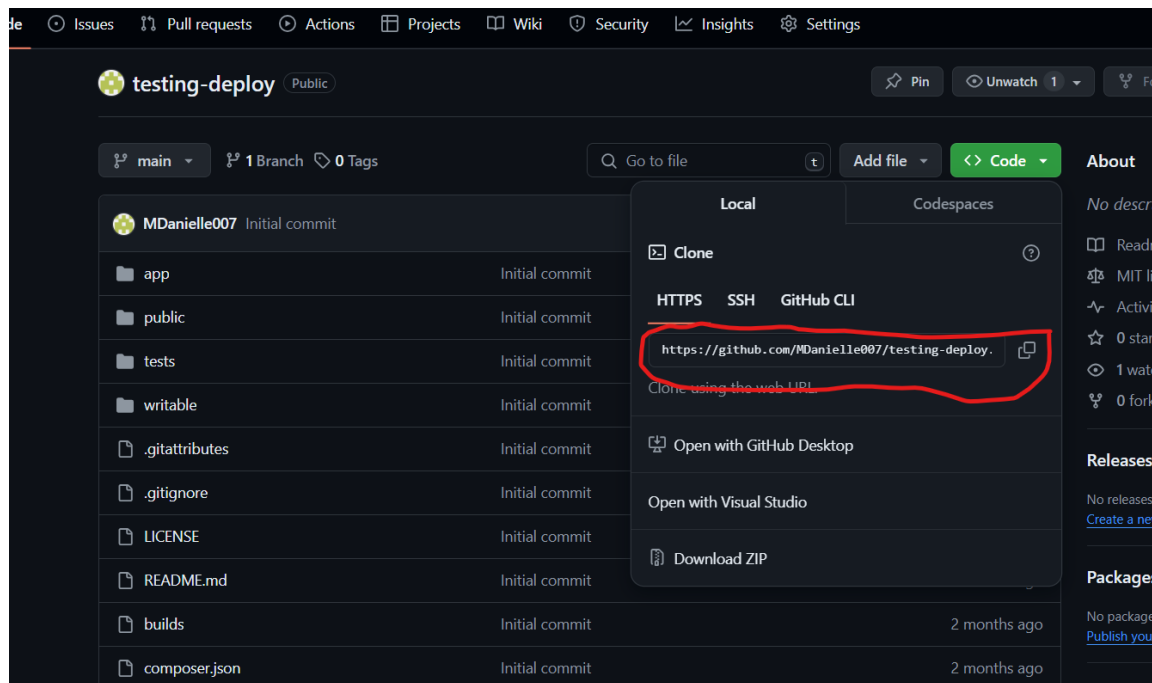

- If you're using a shared account, then click that manage in the account.
- Click the Domain Dropdown to select which domain you're going to use

- Go to the Advanced option then Click GIT.

- Go to your github repository and copy the link of your repository.

- Paste in the repository text field and do specify which branch your backend is located.

Create a New Repository

Deploy application directly from public Git repository. Enter your public repository http URL, branch name and install path. Install path can be left empty, application will be deployed directly to public_html directory.
Install path directory must not contain any files or folders, otherwise deployment will fail.

Repository *

Examples:
For public repositories: https://github.com/WordPress/WordPress.git
For private repositories: git@github.com:WordPress/WordPress.git

Branch *

Usually this is the master branch

- In the Directory text field, follow this kind of naming your directories/folder.

Create a New Repository

Deploy application directly from public Git repository. Enter your public repository http URL, branch name and install path. Install path can be left empty, application will be deployed directly to public_html directory.
Install path directory must not contain any files or folders, otherwise deployment will fail.

Repository *

Examples:
For public repositories: https://github.com/WordPress/WordPress.git
For private repositories: git@github.com:WordPress/WordPress.git

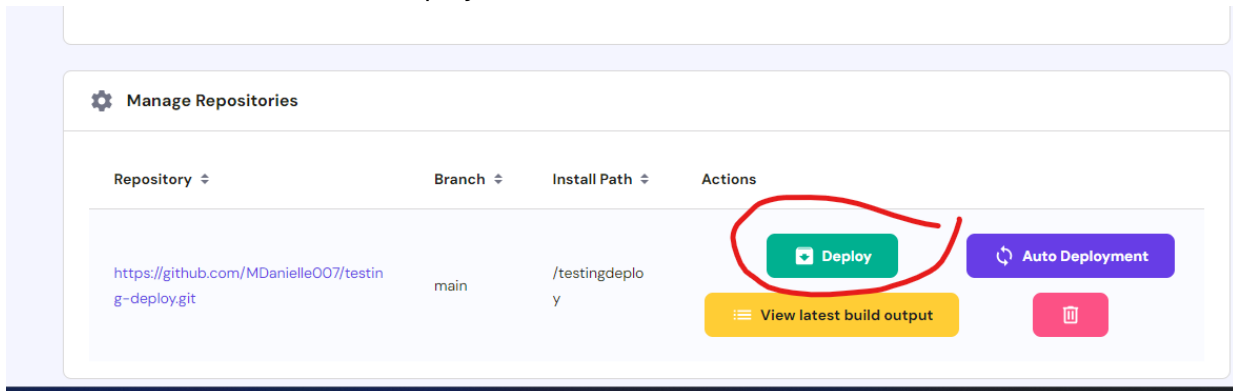

Branch *

Usually this is the master branch

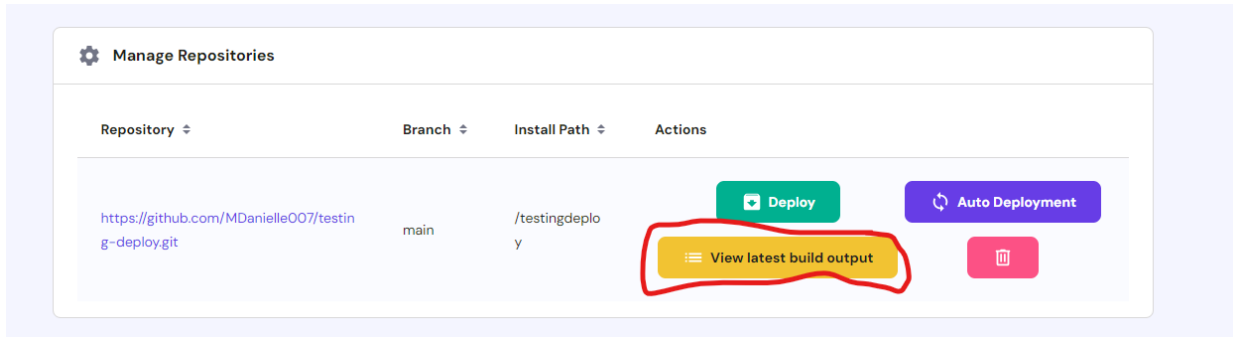

Directory

Leave blank to deploy directly to public_html. Folder must be empty.

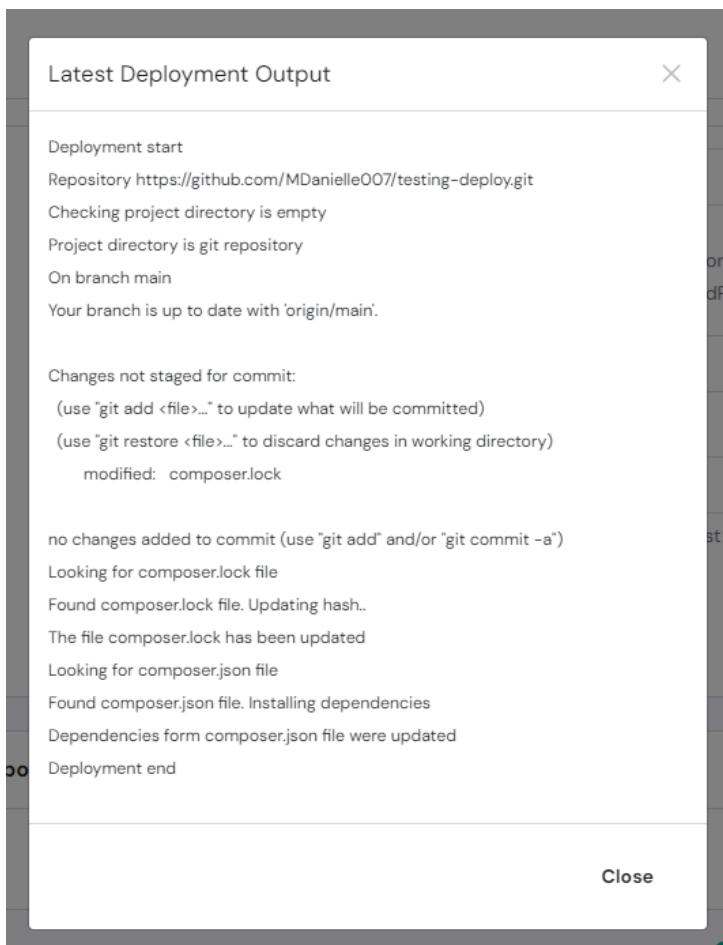

- Wait a few seconds, then click deploy.

- Just to be sure, click the view latest build output

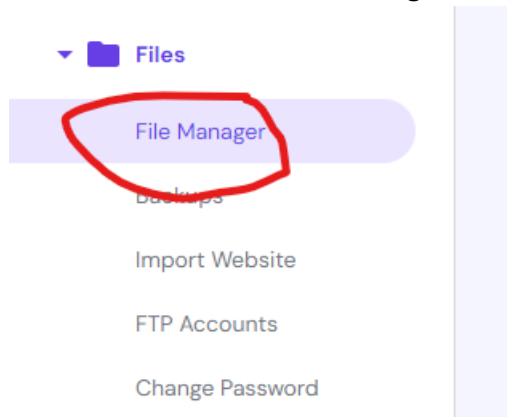

- It should look like this:

- If there's a problem here, the problem must be in your github repository or the project structure

- Go to Files, then click File Manager

- click the left option.

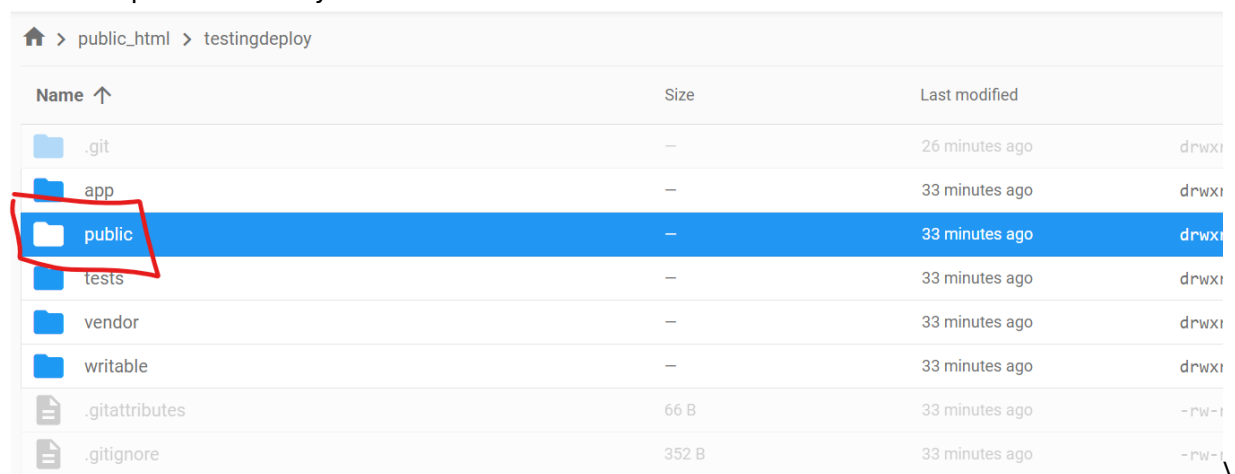

- Click the public_html.

- Delete the default.php and Click the folder inside it

- Go to the public directory.

- Copy all of its contents by highlighting them and pressing CTRL + C.

🏠 > public_html > testingdeploy > public

Name ↑	Size	Last modified	
 .htaccess	1.62 KiB	34 minutes ago	-rw-r--r--
 favicon.ico	5.3 KiB	34 minutes ago	-rw-r--r--
 index.php	1.67 KiB	34 minutes ago	-rw-r--r--
 robots.txt	25 B	34 minutes ago	-rw-r--r--

- Go back to contents of public_html and paste the contents of your public directory.

🏠 > public_html

Name ↑	Size	Last modified	
 testingdeploy	—	29 minutes ago	drwxr-xr-x
 .htaccess	1.62 KiB	a few seconds ago	-rw-r--r--
 favicon.ico	5.3 KiB	a few seconds ago	-rw-r--r--
 index.php	1.67 KiB	a few seconds ago	-rw-r--r--
 robots.txt	25 B	a few seconds ago	-rw-r--r--

- Open the index.php

🏠 > public_html

Name ↓

 testingdeploy

 robots.txt

 index.php

 favicon.ico

 .htaccess

- Find the lines of code for that Paths, it may differ depending on the version of your codeigniter project

```
37 /*
38  *-----
39  * BOOTSTRAP THE APPLICATION
40  *-----
41  * This process sets up the path constants, loads and registers
42  * our autoloader, along with Composer's, loads our constants
43  * and fires up an environment-specific bootstrapping.
44  */
45
46 // LOAD OUR PATHS CONFIG FILE
47 // This is the line that might need to be changed, depending on your folder structure.
48 require FCPATH . '../app/Config/Paths.php';
49 // ^^^ Change this line if you move your application folder
50
51 $paths = new Config\Paths();
```

- Copy what's in the Install Path

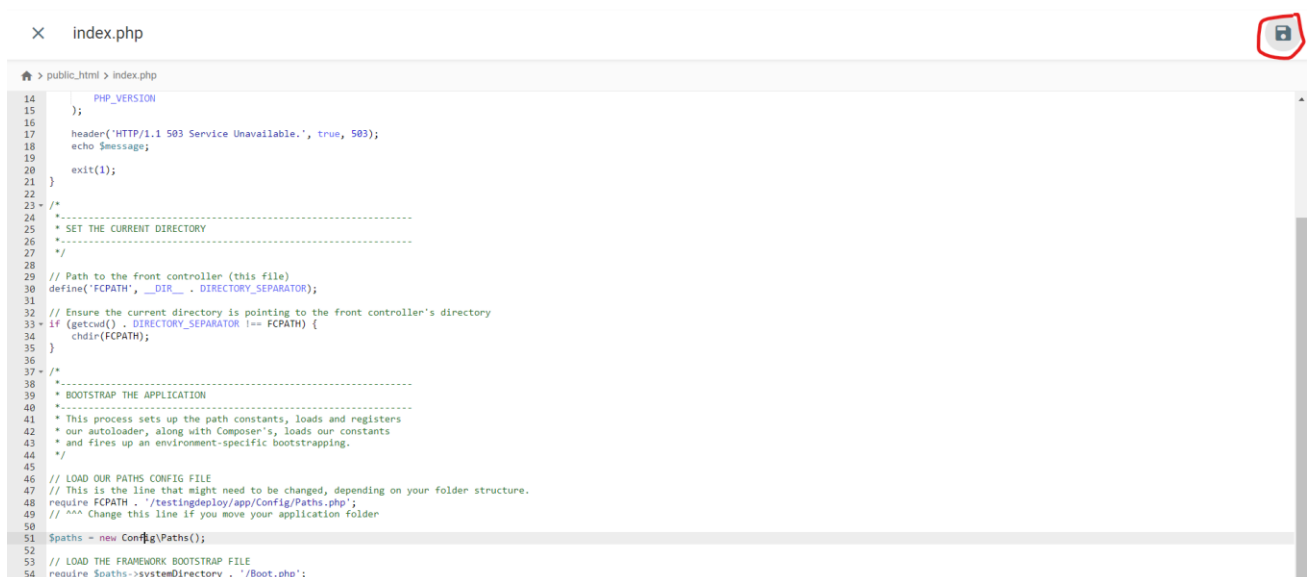

- And replace the two periods with it

```
// LOAD OUR PATHS CONFIG FILE
// This is the line that might need to be changed, depending on
require FCPATH . '../app/Config/Paths.php';
// ^^^ Change this line if you move your application folder
```

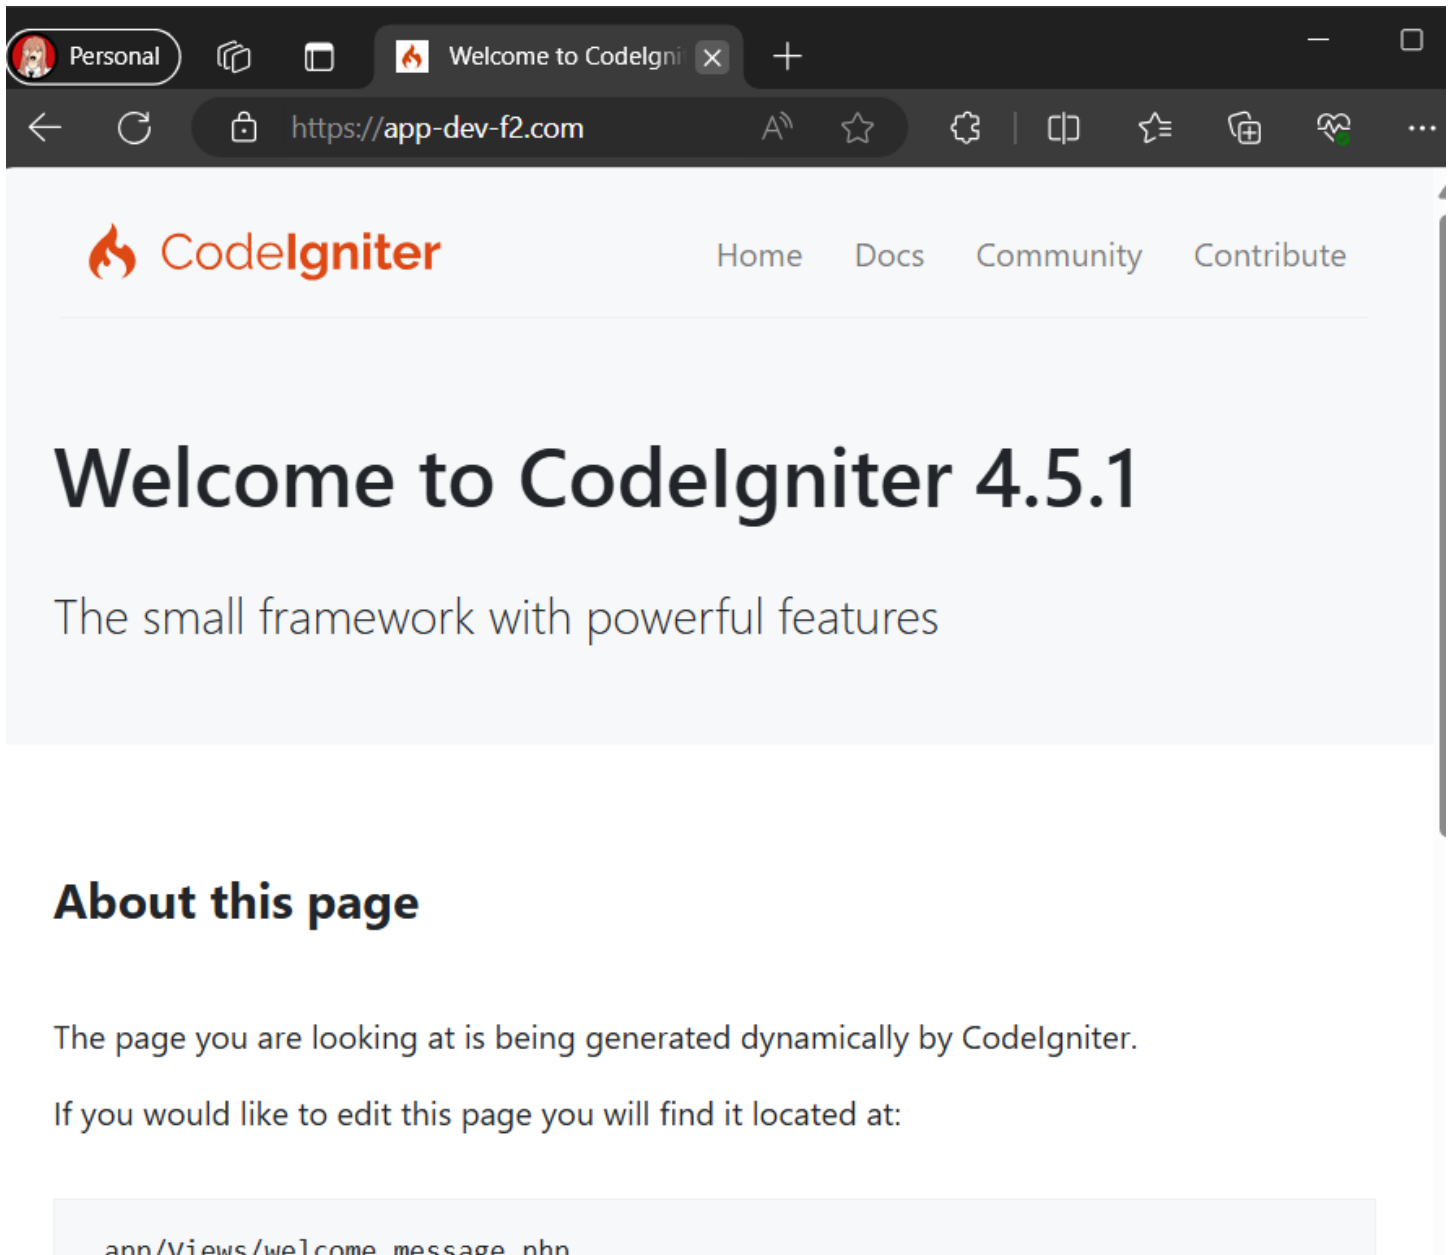

```
// LOAD OUR PATHS CONFIG FILE
// This is the line that might need to be changed, depending on your folder struct
require FCPATH . '/testingdeploy/app/Config/Paths.php';
// ^^^ Change this line if you move your application folder

$paths = new Config\Paths();
```

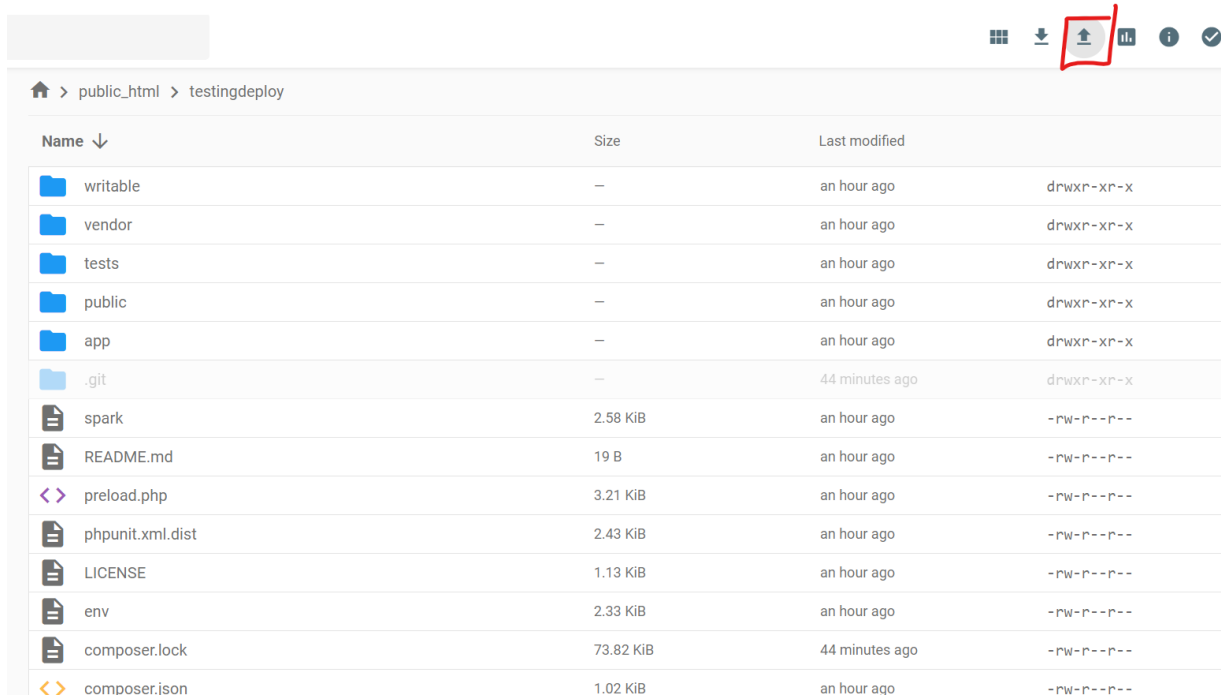

- Click CTRL + S to save or just click the save button at the upper right of the screen.

- You should be able to access your codeigniter project by accessing your-domain

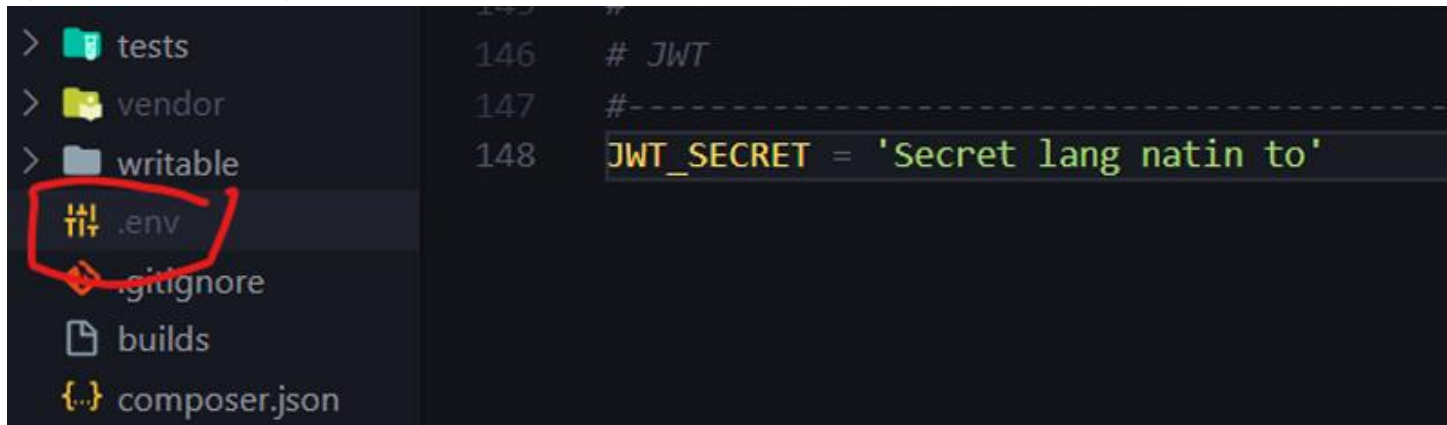

- If you use jwt the same way as I do, go back in the file manager directory of your backend in hostinger, then click upload button the upper right options.

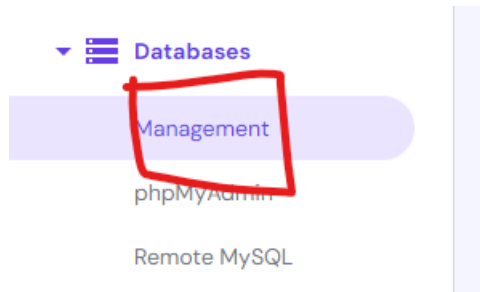

- Click the File

- Upload the .env file in your backend code.

- Go to the Database, then click the Management option.

- Create your database by filling out this text fields, then click create.

A screenshot of the 'Management' page in phpMyAdmin. The 'Create a New MySQL Database And Database User' form is shown. The 'MySQL database name' field is 'testingdeploy', the 'MySQL username' is 'tester', and the 'Password' is 'TestingDeploying123'. The 'Create' button is highlighted with a green checkmark.

- Go to your database in the phpMyAdmin of laragon/wamp/xampp, then export your database

A screenshot of the phpMyAdmin interface showing the 'Export' option selected in the top navigation bar. Below, the 'Export' dialog is open, showing the 'Export method' set to 'Quick' and the 'Format' set to 'SQL'. The 'Export' button is highlighted with a red circle.

- Now, edit file your exported in vs code and look for the line the says – Database

```
testingdeploy.sql X
C: > Users > HUAWEI > Downloads > testingdeploy.sql
1  -- phpMyAdmin SQL Dump
2  -- version 5.2.1
3  -- https://www.phpmyadmin.net/
4  --
5  -- Host: localhost:3306
6  -- Generation Time: Jun 18, 2024 at 11:48 AM
7  -- Server version: 8.0.30
8  -- PHP Version: 8.1.10
9
10 SET SQL_MODE = "NO_AUTO_VALUE_ON_ZERO";
11 START TRANSACTION;
12 SET time_zone = "+00:00";
13
14
15 /*!40101 SET @OLD_CHARACTER_SET_CLIENT=@@CHARACTER_SET_CLIENT */;
16 /*!40101 SET @OLD_CHARACTER_SET_RESULTS=@@CHARACTER_SET_RESULTS */;
17 /*!40101 SET @OLD_COLLATION_CONNECTION=@@COLLATION_CONNECTION */;
18 /*!40101 SET NAMES utf8mb4 */;
19
20 --
21 -- Database: `testingdeploy`
22
23
24 --
25
26 --
27 -- Table structure for table `user`
28 --
29
30 CREATE TABLE `user` (
31   `id` int NOT NULL,
32   `email` text COLLATE utf8mb4_swedish_ci NOT NULL,
33   `username` text COLLATE utf8mb4_swedish_ci NOT NULL,
34   `password` text COLLATE utf8mb4_swedish_ci NOT NULL
35 ) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_swedish_ci;
36
37 --
38 -- Indexes for dumped tables
39 --
```

- Copy the name of your newly created database in hostinger and paste it there.

⚙️ List of Current MySQL Databases And Users

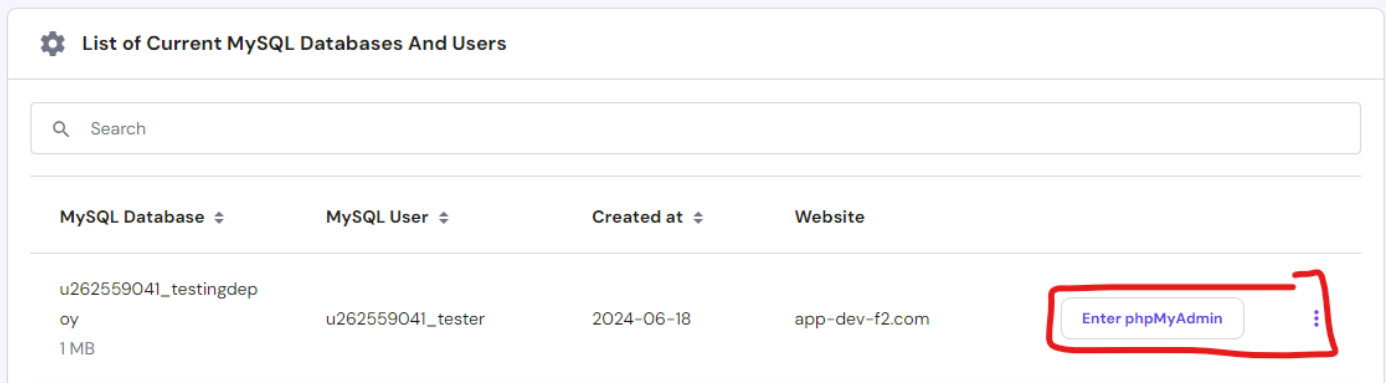

🔍 Search

MySQL Database ↕	MySQL User ↕	Created at ↕	Website	
u262559041_testingdeploy 1 MB	u262559041_tester	2024-06-18	app-dev-f2.com	<div>Enter phpMyAdmin ⋮</div>

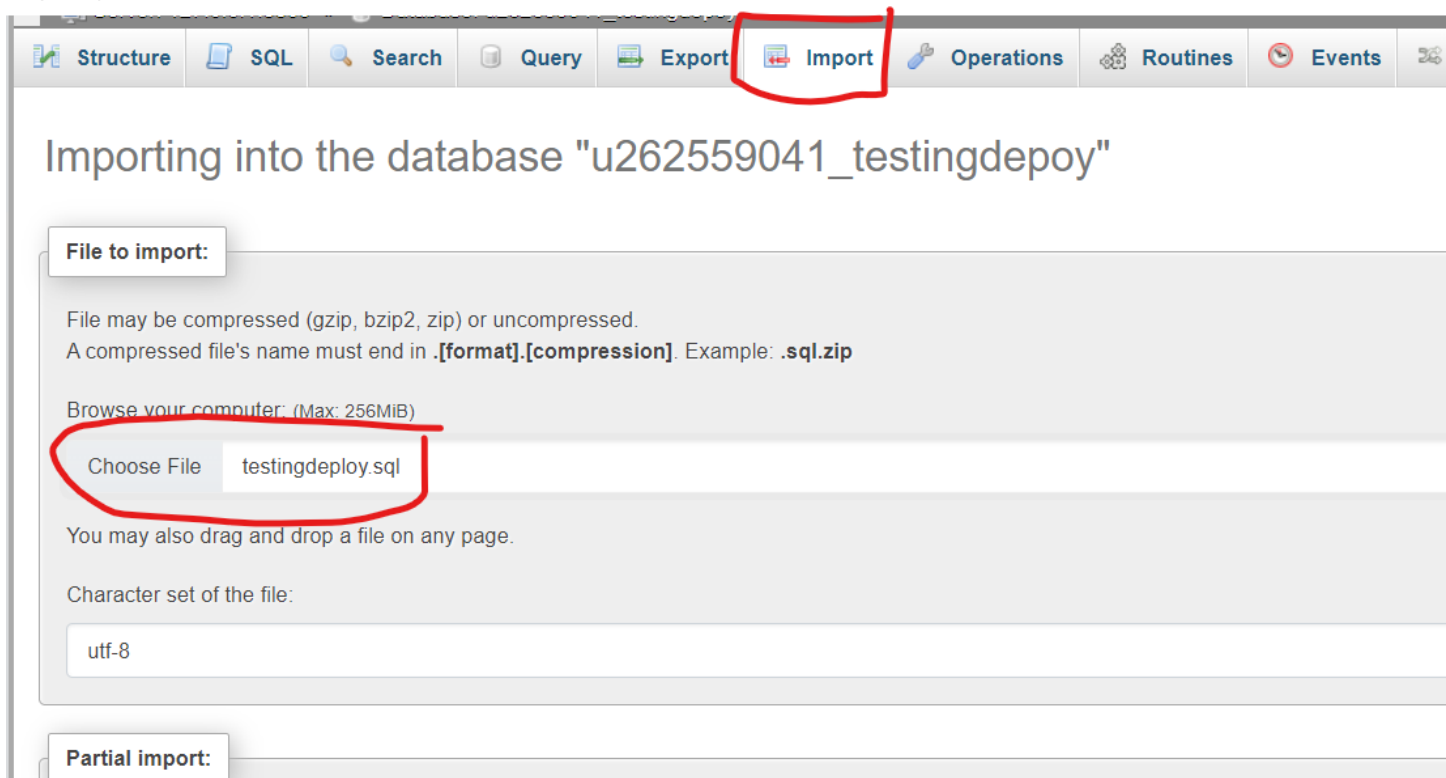

```
/*!40101 SET NAMES utf8mb4 */;
--
-- Database: `u262559041_testingdeploy`
--
```

- You might encounter an error in the collations, so change all collations in your tables to “**utf8mb4_swedish_ci**”.
- Save the file

- Click the Enter phpMyAdmin.

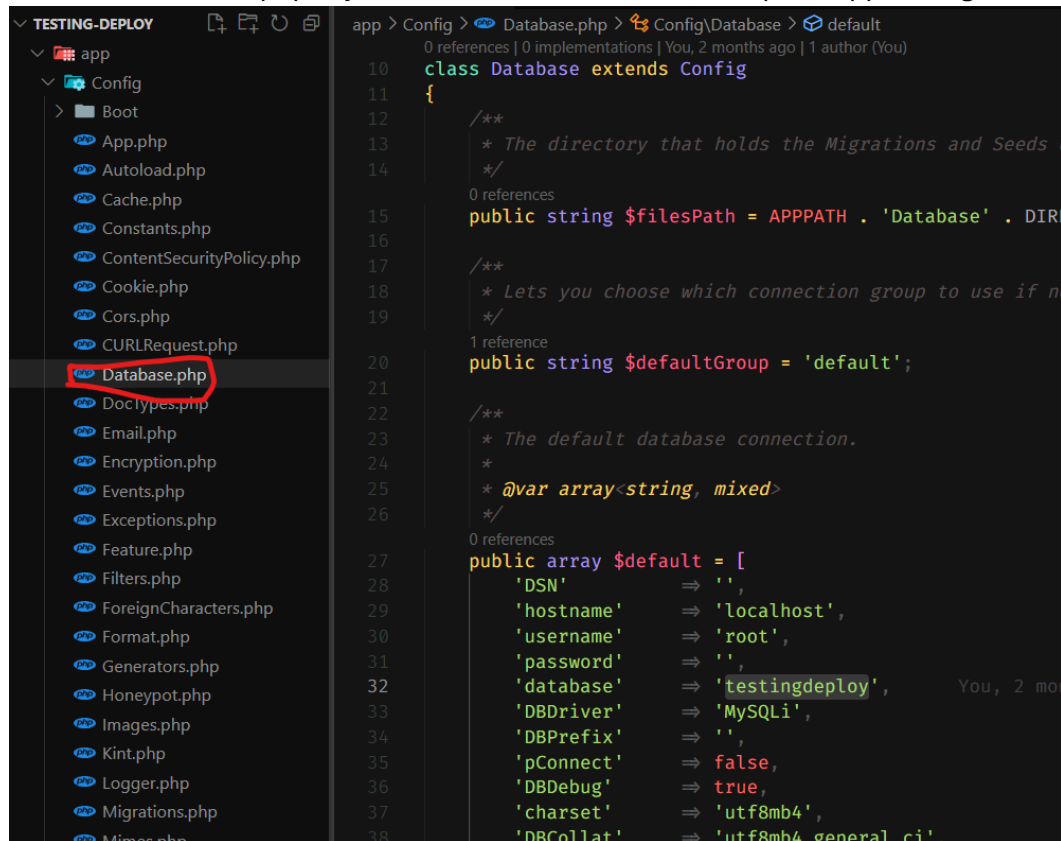

- Import your database.

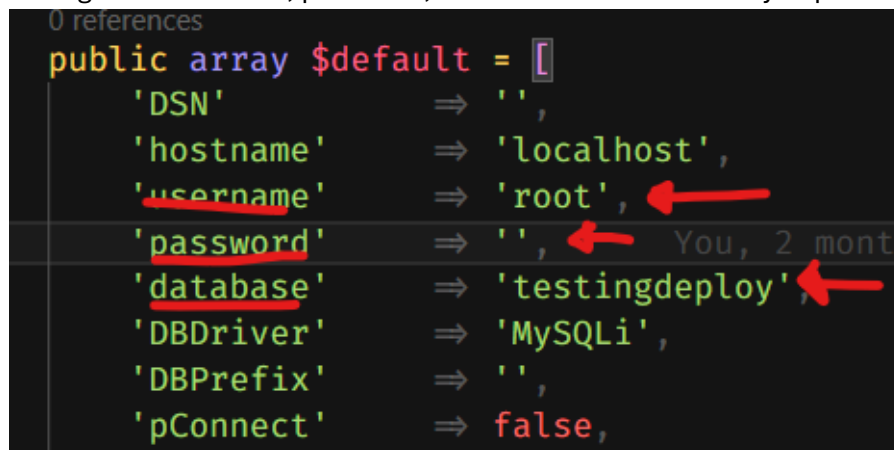

- Scroll Down, then click Import.

- Go to the Database.php in your backend. It is located in this path: app\Config\Database.php

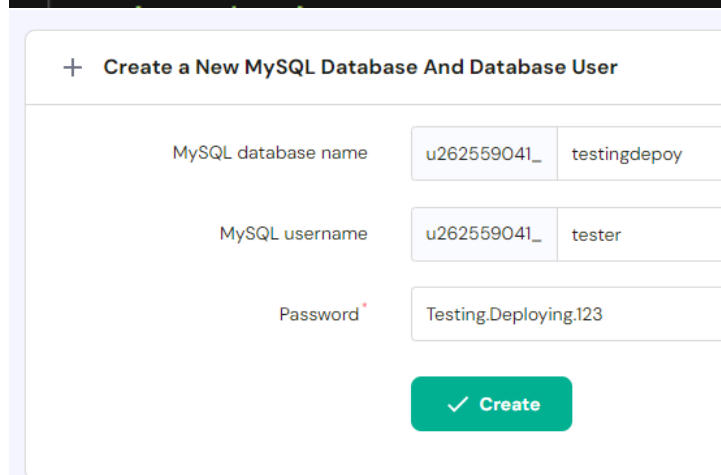

```
app > Config > Database.php > Config\Database > default
0 references | 0 implementations | You, 2 months ago | 1 author (You)
10 class Database extends Config
11 {
12     /**
13      * The directory that holds the Migrations and Seeds
14      */
15     public string $filePath = APPPATH . 'Database' . DIRSEP . 'Migrations';
16
17     /**
18      * Lets you choose which connection group to use if no
19      */
20     public string $defaultGroup = 'default';
21
22     /**
23      * The default database connection.
24      *
25      * @var array<string, mixed>
26      */
27     public array $default = [
28         'DSN' => '',
29         'hostname' => 'localhost',
30         'username' => 'root',
31         'password' => '',
32         'database' => 'testingdeploy',
33         'DBDriver' => 'MySQLi',
34         'DBPrefix' => '',
35         'pConnect' => false,
36         'DBDebug' => true,
37         'charset' => 'utf8mb4',
38         'DBCollat' => 'utf8mb4_general_ci',
39     ];
40 }
```

- Change the username, password, and database to the ones you put in the management.

```
0 references
public array $default = [
    'DSN' => '',
    'hostname' => 'localhost',
    'username' => 'root',
    'password' => '',
    'database' => 'testingdeploy',
    'DBDriver' => 'MySQLi',
    'DBPrefix' => '',
    'pConnect' => false,
```

+ Create a New MySQL Database And Database User

MySQL database name	u262559041_	testingdeploy
MySQL username	u262559041_	tester
Password	Testing.Deploying.123	

✓ Create

- It should something like this:

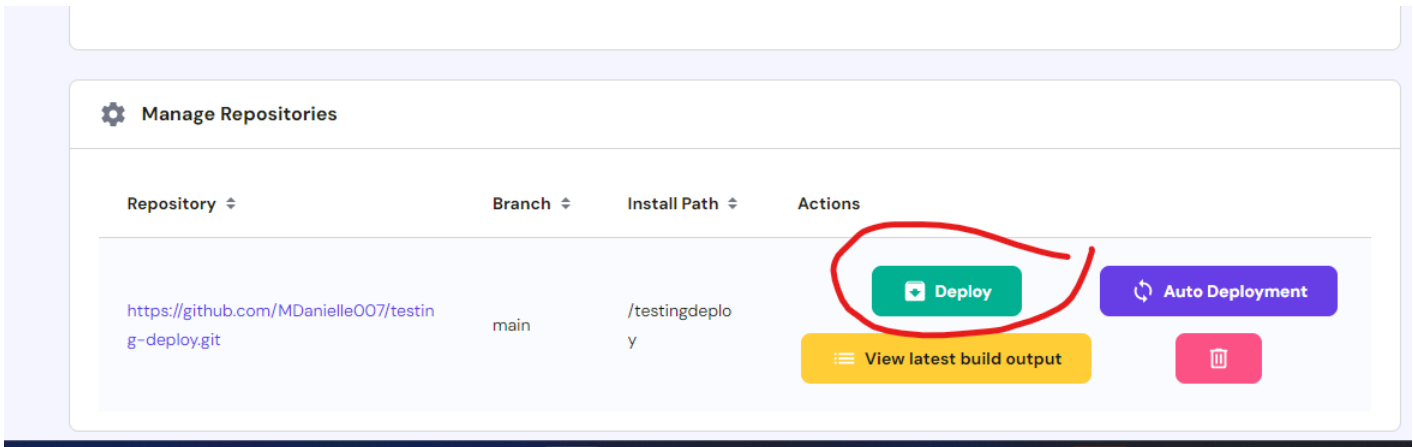

```
0 references
public array $default = [
    'DSN'           => '',
    'hostname'      => 'localhost',
    'username'      => 'u262559041_tester',
    'password'      => 'Testing.Deploying.123',
    'database'      => 'u262559041_testingdepoy',
    'DBDriver'      => 'MySQLi',
    'DBPrefix'      => '',
    'pConnect'      => false,
    'DBDebug'       => true,
    'charset'       => 'utf8mb4',
    'DBCollat'      => 'utf8mb4_general_ci',
    'logPrefix'     => ''
];
```

- Go to the App.php in your backend. It is located in this path: app\Config\App.php. Add a new baseURL that is your domain

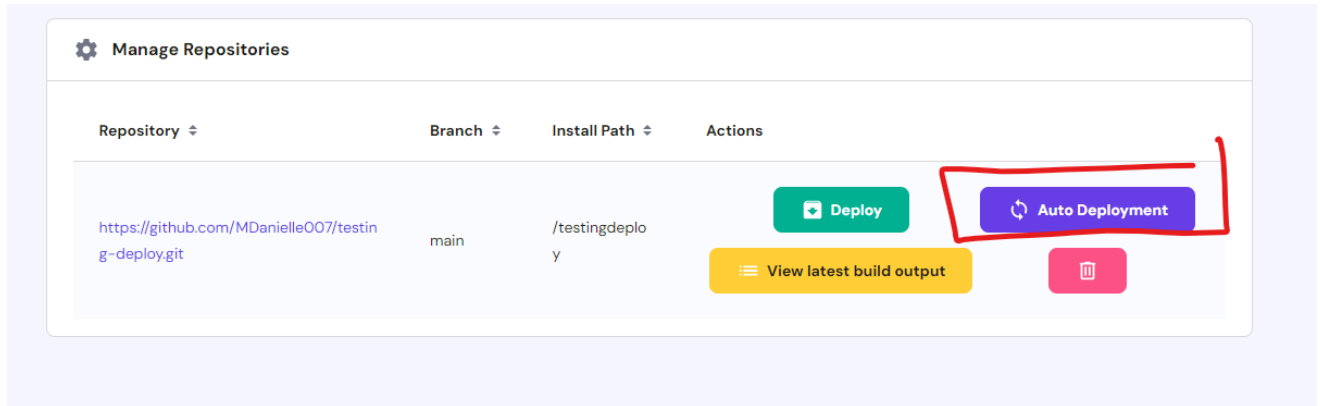

```
6
3 references | 1 implementation | You, 1 minute ago | 1 author (You)
7 class App extends BaseConfig
8 {
9     /**
10      *
11      * Base Site URL
12      *
13      *
14      * URL to your CodeIgniter root. Typically, this will be your base URL,
15      * WITH a trailing slash:
16      *
17      * E.g., http://example.com/
18      */
19     // public string $baseURL = 'http://localhost:8080/';
20     public string $baseURL = 'https://app-dev-f2.com/';
21
22
23     /**
24      * Allowed Hostnames in the Site URL other than the hostname in the baseURL.
25      * If you want to accept multiple Hostnames, set this.
26      *
27      * E.g.,
28      * When your site URL ($baseURL) is 'http://example.com/', and your site
29      * also accepts 'http://media.example.com/' and 'http://accounts.example.com/':
30      * ['media.example.com', 'accounts.example.com']
31      *
32      * @var list<string>
33      */
```

- Save the File, then push the changes in your backend.

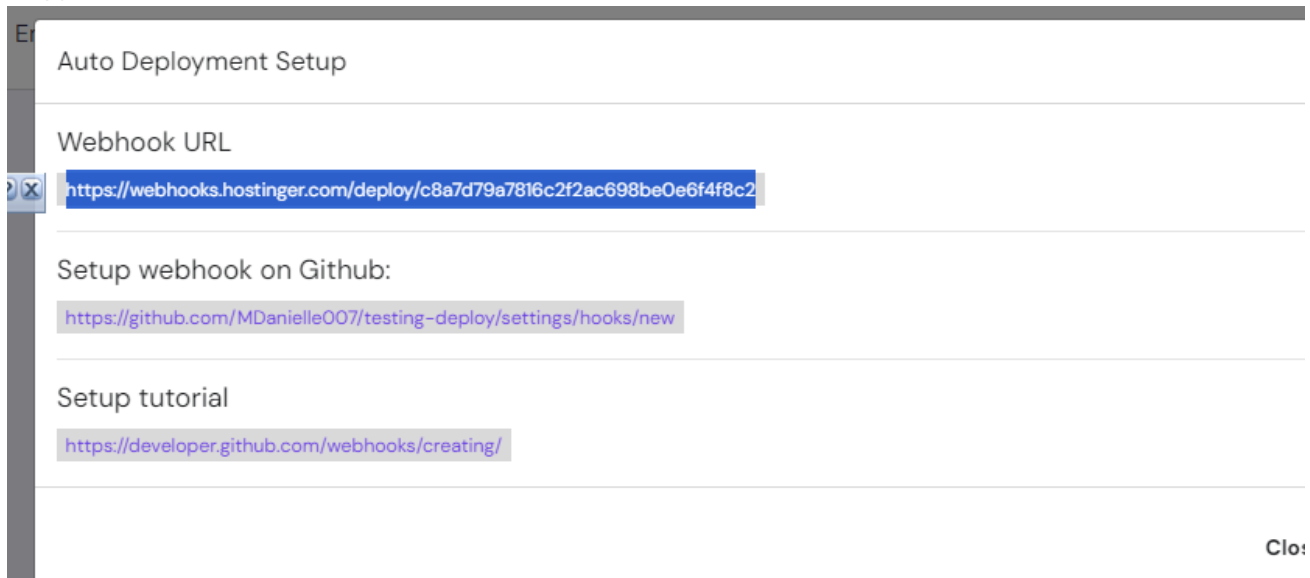

➤ Just to ensure you updated your code, click the Deploy again.

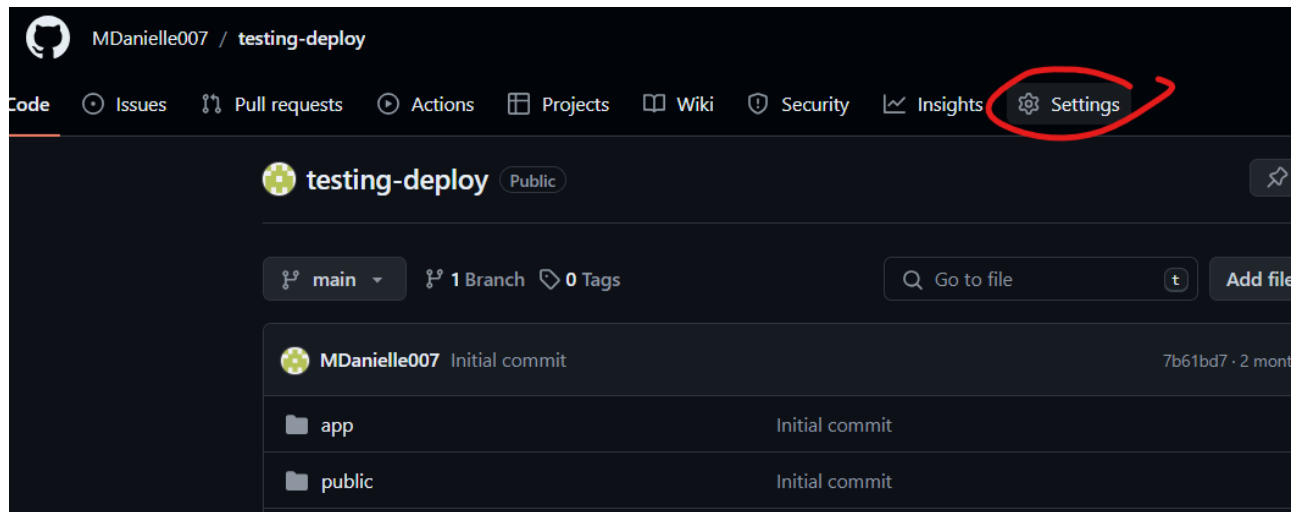

➤ For Auto-deployment, Click the Auto Deployment

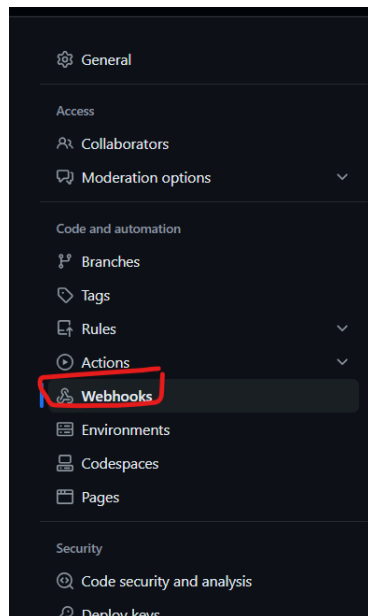

➤ Copy the WebhookURL

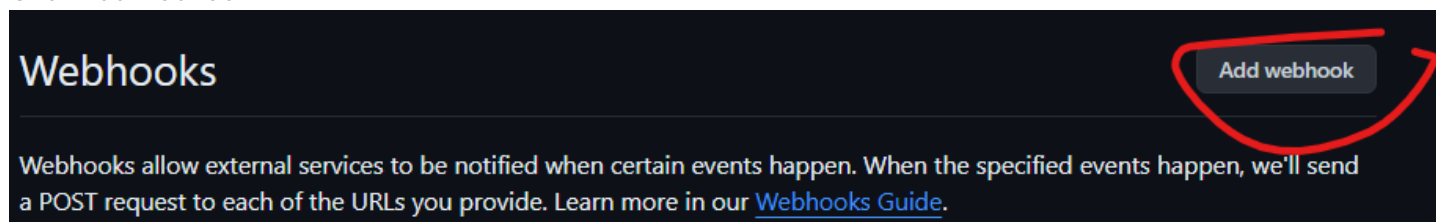

➤ Go to the Setting of your github repository

➤ Select the Webhooks

➤ Click Add webhook

➤ Paste the Webhook URL you've copied into the Payload URL, then click Add Webhook

Webhooks / Add webhook

We'll send a **POST** request to the URL below with details of any subscribed events. You can also specify which data format you'd like to receive (JSON, `x-www-form-urlencoded`, etc). More information can be found in [our developer documentation](#).

Payload URL *

`https://webhooks.hostinger.com/deploy/c8a7d79a7816c2f2ac698b`

Content type

`application/x-www-form-urlencoded` ⌵

Secret

SSL verification

 By default, we verify SSL certificates when delivering payloads.

☒ **Enable SSL verification** ☐ **Disable (not recommended)**

Which events would you like to trigger this webhook?

- ☒ Just the push event.
- ☐ Send me **everything**.
- ☐ Let me select individual events.

☒ Active

We will deliver event details when this hook is triggered.

Add webhook
